A secure, authenticated and auditable Remote Access solution that allows schools to control the extent of the network access available to each member of staff while physically away from the school site.

Secure Remote Access

Home   School Network   Worldwide

Secure service for all staff

RAv3 allows staff to connect securely into their school's local network via an easy-to-use web interface using the same familiar set of user credentials as other core services such as email.

School level control

Different levels of external access to a school's network can be configured for school staff via Atomwide's Support Site. Schools are able to configure the following access for staff users:

- Access to an intranet or a secure internal website

- Access to shared drives on the network or a user's home area

- Access to a static IP address, which is contacted via an RDP-type connection but which works through a web browser. The user simply clicks on a pre-configured link to be presented with the login screen of their office-based computer

- Access to a static IP address via a VNC connection

- Access to a non-static IP via an RDP connection

School technical staff can also configure full VPN remote network access for themselves or other network administrators.

Easy-to-use service for all

Once access has been configured, users log in to the front end via a web browser and click on ordinary web links to access the resources that have been made available to them. Users do not need a high degree of technical ability in order to make use of the functionality.
